RSWU-4SPDTS

4 Channel SPDT Switch, Non-reflective, 100 kHz … 8500 MHz

Features

- extremely wideband
- high speed, wear-free semiconductor switches
- non reflective

Applications

- RF signal routing
- RF switching fields and matrices
- R&D (Research & Development)
- radio monitoring
- production

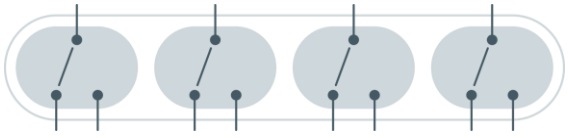
Scope

The RSWU-4SPDTS is a four channel SPDT switch, suitable for the frequency range 100 kHz … 8500 MHz in 50 ohms technology. All switches are non-reflective, they offer also termination in the open states.

RSWU-4SPDTS is designed as a slide-in module for integration into the SR6-11C system platform. In combination with the SR6-CU controller module it can be easy controlled with ASCII strings.

Principal Block Diagram

The RSWU-4SPDTS+ has 4 independent SPDT RF switches. The module offers high isolation between the switch channels, they can used separate with different signals without the influence from adjacent channels.



Wear-free Semiconductor Switches

The switching elements in the RSWU-4SPDTS are solid state types. This ensures a short switching time and a huge number of switching cycles with a minimum of maintenance.

Synchronous Operation

In combination with the SR6-CU controller, the execution of switching commands can be done in two ways:

- Direct switch execution after receiving single commands.
- Common synchronous switching after executed by a SYNC command.

In the synchronous switching mode commands are received without execution. After receiving a SYNC command, all switching operations are done at the same time.

Remote Control

In combination with the SR6-CU controller module, the RSWU-4SPDTS is remote controllable via standard interfaces USB and LAN with simple SCPI orientated ASCII strings.

Built-In Test Function

Internal supply voltages are monitored. The module status can be read out via remote interface.

SR6-11C System Platform

The RSWU-4SPDTS module is foreseen for the integration into the SR6-11C system platform. 11 slots in the SR6-11C can be used for modules like RF switches, matrices, multicouplers, attenuators, BIAS-Ts, level detectors, bi-directional splitters/combiners for signal conditioning and a controller unit. For the control of RSWU-4SPDTS module the SR6-CU controller unit is required.

Via the Trigger-IO interface at the rear side of the SR6-11C System Platform a synchronous operation in a device network of SR6-11C can be realized. After a positive TTL pulse slope at the trigger input, the preloaded configurations are executed only by hardware in micro seconds. In applications with very fast execution demands the hardware can be directly controlled via the binary interface on the rear side.
